

VOLTRA

Understanding the website, page by page — what each part is for, and why

This is a plain-language walkthrough of every page in the Voltra prototype — what it does, why it exists, and how it fits the bigger picture. Read it in one sitting or a section at a time; each one stands on its own.

1. Home

The very first thing anyone sees — like the front window display of a shop. Its only job is to answer two questions in three seconds: "What is this?" and "Is this for me?"

This is why the audience toggle — "Shopping for myself" vs. "I run a shop" — sits right at the top. It immediately splits visitors onto the right path instead of making them dig around for what's relevant to them.

2. Shop / Search

The actual "aisle" of the store, where browsing happens.

Think of walking into a real electronics shop: some people know exactly what they want (so they use the search bar — type "earbuds," it filters instantly), while others browse loosely (so they use category buttons — Power Banks, Earphones, Headsets, Accessories — like walking down labeled aisles). Both need to exist because different customers shop differently.

3. Product Detail Page

The step from "a quick glance" to "everything I need to decide."

On a product card, you only see the name, a short line, and the price — like the front cover of a book. The detail page is like opening that book: full description, specs (battery capacity, charging speed, connector type), and a "Notify me if this runs low" button. That last feature matters — if a product is about to run out, instead of losing the customer entirely, you capture their interest and reach out the moment it's restocked. A near-miss becomes a saved sale instead of a lost one.

4. Cart

The basket you're physically carrying around the shop before you pay.

It needs to show three things clearly: what's in it, how much of each, and the total cost — plus let you change your mind before committing. The cart "remembers" what's in it even after closing it, the

same way a real shop lets you leave your basket at the counter and come back rather than starting over.

5. Checkout

The counter where you actually pay — not yet fully built in this prototype, but here's the concept.

In a real version, this is where a buyer picks a delivery address, chooses Paystack, Flutterwave, or cash on delivery, and confirms the order. This prototype stops here on purpose — it's the "kitchen" part (the backend) that isn't built yet, explained further in the terms section below.

6. Retailer Dashboard

Exists only for B2B customers — the shop owners, not individual buyers.

Think of it like a car dashboard: at a glance, without digging, the driver sees fuel level, speed, warning lights. Same idea here — outstanding balance (what a retailer currently owes, from the trade-credit feature), a stock-health list (a traffic-light system — green, amber, red — showing which products are running low), and recent order history, so a retailer never has to ask "did my last order go through?"

7. Restock Plan

A specific tool inside the retailer experience — not just information, but an action a retailer can set up once and forget.

A retailer tells the platform: "check on me every Tuesday, and track these three products." From then on, the relationship becomes proactive — Voltra reaching out to them — instead of reactive, where they only call once they've already run out.

8. Settings

Where a user manages their own preferences, not where they browse or buy.

Two useful things live here: notification choices (WhatsApp, SMS, or email — different people prefer different channels, so the platform lets them pick), and saved payment methods, for convenience on repeat visits.

9. Support (WhatsApp Button)

The "excuse me, can I get some help" button.

Instead of a contact form nobody fills out, it's a floating WhatsApp icon — because that's genuinely how customers already prefer to communicate in Nigeria. Meeting people where they already are, rather than forcing them into an unfamiliar system.

How it all connects as one story

A customer lands on **Home** → browses **Shop** → opens a **Product Detail Page** to learn more → adds it to **Cart** → checks out. A retailer, meanwhile, lands on **Home** → switches to "I run a shop" → checks their **Dashboard** to see what needs reordering → either places a bulk order or lets their **Restock Plan** handle it automatically → adjusts **Settings** for how they want to be notified. Every piece exists to serve one of those two real journeys — nothing is decorative.
